Comment

- is indicated for homozygous allele. Needs to be confirmed by parental typing.

G code: G code is a group of alleles that have identical nucleotide sequences in the antigen recognition site. Allele Database Version used in the report is 3.42.0 & Software version is 2.20.2.19673 Refer Appendix-I for G-Groups and NMDP (National Marrow Donor Program) codes.

Interpretation

The HLA typing of Rasha (Patient) and Misbah (Potential donor) shows 05/10 allele match (50% match at each locus).

Test Details

Test

DNA extracted from blood was used to amplify the HLA genes of interest by NGSgo kit from GenDx by long-range PCR, followed by fragmentation and library preparation to be sequenced on the Miseq Illumina platform. The libraries were sequenced to mean >80-100X coverage on Illumina sequencing platform. The raw sequence reads are aligned using a FASTA-like algorithm. Instead of aligning the reads to a single reference however, the reads are aligned to all the alleles in the library. The IMGT/HLA database is used as the source of HLA alleles [5].

To determine the SNP haplotypes, every position in the reference is evaluated to define homo- or heterozygosity. The heterozygous positions are evaluated to determine the cis-trans relationships (called phasing) between the bases at the individual heterozygous positions. All alleles in the library are compared against the possible haplotypes found in the previous steps. The number of nucleotide mismatches with each allele is determined, as well as the number of mismatches with the determined phasing data. Mismatches at exons and introns are treated separately. A list of alleles is selected with a limited number of mismatches.

From these alleles, all possible genotypes are generated which will contain the most likely genotype(s) present in the original dataset. For each of these genotypes, the mismatch level of the two alleles with the phased data is determined. The genotype(s) with the lowest mismatch count is (are) reported.

Disclaimer:

- HLA genotypes were determined based on the IMGT/HLA database release 3.42.0. The occurrence of HLA genotyping results and the number of different allele combinations by a NGS assay for an individual may change according to the version of the IMGT/HLA database release. Please contact MedGenome at a later date for any change.

ESTIMATE CERTIFICATE

TO WHOM IT MAY CONCERN

This is to certify that Ms. Rasha, Age 07 years, Female, D/o Mr. Shahzad, (UHID-105051130 & IRCH No. 241609/20) is a known case of Acute Myeloid Leukemia and is under treatment with Medical Oncology at DR. BRA IRCH, AIIMS since 30.01.2020.

The approximate cost for her treatment would be Rs. 12,00,000/- (Rupees Twelve Lakhs Only). The item-wise breakup of the expenditure is as under:-

S.No.	Name of Medicines with dosage/Consumables Required for treatment/operation	Duration of treatment	Approx. cost	Remarks (if any)
1.	Conditioning regimen	Single Time	Rs. 3,00,000/-	
2.	Stem Cell Harvest	Single Time	Rs. 2,00,000/-	
3.	Supportive care	Single Time	Rs. 4,00,000/-	
4.	Post Transplant Follow up	01 Year	Rs. 3,00,000/-	
	Total approximate cost of the treatment		Rs. 12,00,000/-	

The cheque/draft may be sent in favour of "DR. BRA IRCH, AIIMS, Ansari Nagar, New Delhi-29 (IRCH Patient Treatment Account)"
